| Promishe interference: secondary jone 25% systems from primary ion.   Analyst. Instr.   Both the GC/FID and GC/MSD were used for the analysis of n-alicanes and ketiones.   The most RSD% of n-alicanes, alikan-2-one and other compounds were bigger in the GC/MSD than in the GC/FID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 1   |                                                                                                              |                                                                                                                                  |                                                                                                                                   |                                                                                                                                |                                                                                                                                         |                                                                                                                                                   |                                                                                                                                                |             |
| Analyt. Instr. Both the GCFID and GCMSD were used for the analysis of n-alizanes and ketones. The most RSD/6 of-alizanes, alizan-2-one and other compounds were bigger in the GCMSD than in the GCFID. "SRM 1649a samples were analyzed using two different calibration curves. The QC check standards associated with the SRM 1649a samples analyzed using the first curve passed for the PAHs and retene only). A second analysis using a different calibration curve was performed for quantition of all of the other analysis (the PAHs and retene failed QC check standards on the second analysis). Therefore, the PAHs and retene were reported from the first analysis and all of the other analysis were reported from the second analysis. The first calibration curve is the same as the one used for quantitation of the interim RM samples. The second calibration curve used 4 or 5 points for the carbonyls (concentration range of approximately 833-8330 ng/g or 167-8330 ng/g, 4, 5, or 6 points for the alkanes (concentration range of approximately 833-, 167-, or 83.3-8330 ng/g), and 5 or 6 points for the hopeanes and cholestanes (concentration range of approximately 833-8330 ng/g). Additionally, some samples required a diluted re-analysis for some analyses due to those analyses exceeding the upper limit of the calibration curve in the original analysis. These samples were analyzed using a third calibration curve.

# Charts of Air Particulate Extract I (QA01EXT01) and SRM 1649a Results by Analyte

See Tables 1 and 3 for results reported as < number, detection limit, etc.

Charts for analytes with only one reported numerical result are not included in this appendix.

For Air Particulate Extract I plots:

Solid line: exercise assigned value

Dotted line:  $z = \pm 1$ , i. e., 25 % from assigned value

Dotted/dashed line:  $z = \pm 2$ , i. e., 50 % from assigned value

Dashed line:  $z = \pm 3$ , i. e., 75 % from assigned value

#### For SRM 1649a plots:

Solid line: material certified concentration or target value (see caption of each plot)

Dotted line: 95 % confidence interval (CI)

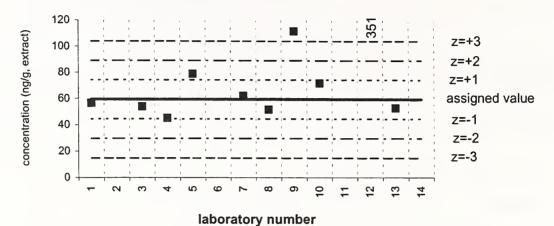

Dashed line: 30 % from 95 % confidence interval (CI)

### Appendix E

# Charts of Air Particulate I (QA01APT01) and SRM 1649a Results by Analyte

See Tables 2 and 3 for results reported as < number, detection limit, etc.

Charts for analytes with only one reported numerical result are not included in this appendix.

#### For Air Particulate I plots:

Solid line: exercise assigned value

Dotted line: z = ± 1, i. e., 25 % from assigned value

Dotted/dashed line:  $z = \pm 2$ , i. e., 50 % from assigned value

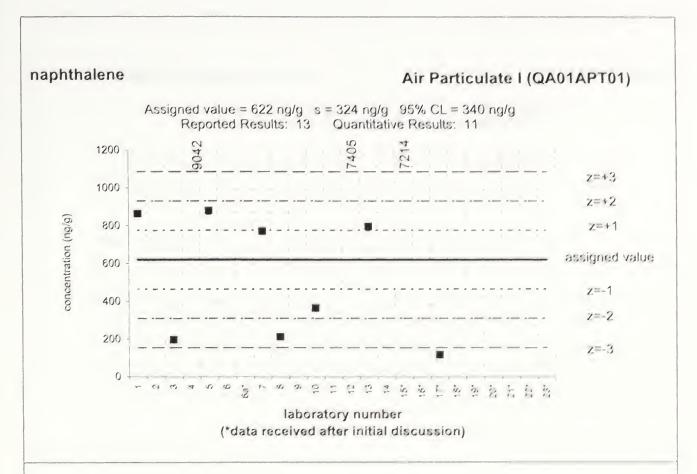

Dashed line:  $z = \pm 3$ , i. e., 75 % from assigned value

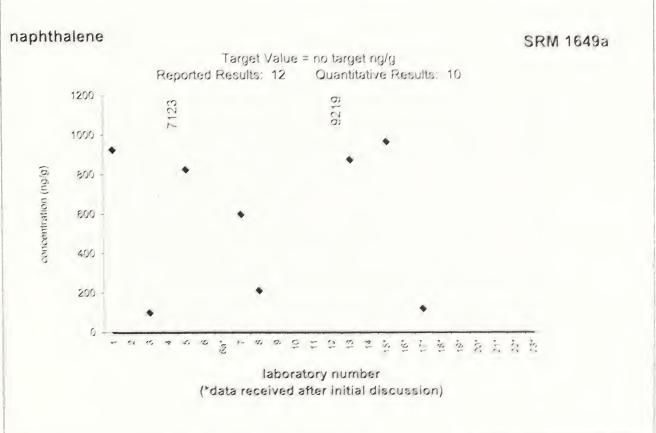

#### For SRM 1649a plots:

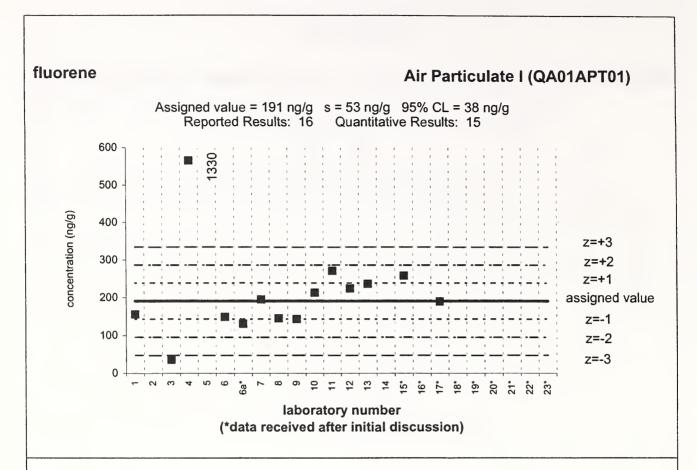

Solid line: material certified concentration or target value (see caption of each plot)

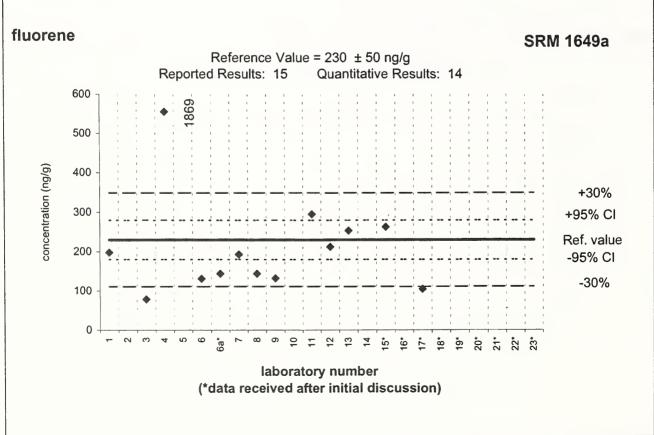

Dotted line: 95 % confidence interval (CI)

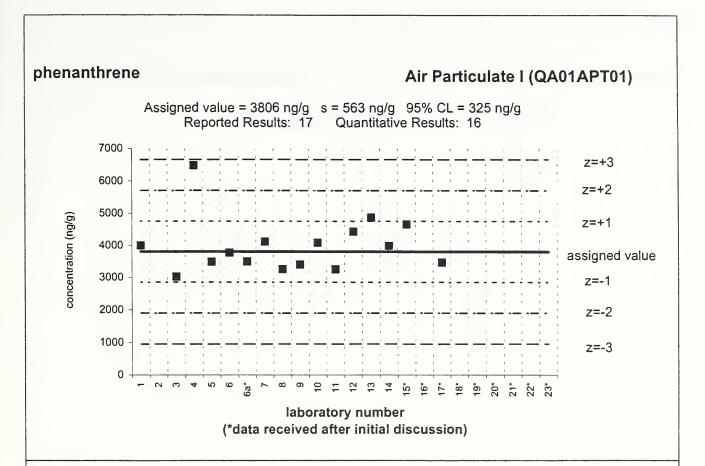

Dashed line: 30 % from 95 % confidence interval (CI)
